

## ALPHABET:

Alphabet is the parent company for Google. Google uses multiple software languages such as C, C++, Go, Java, Python, and Node. Most job listings that I can find have qualifications for experience with multiple languages, not just one. This link lists the technology stack that Alphabet uses. I have heard of most of the ones listed besides Drupal.

<https://6sense.com/company/alphabet/5c3b01abd55ae49f1b7830b6>

## IBM:

International Business Machines corp does a lot with securing cloud software, creating AI tools, and data solutions. They use the language COBOL along with other ones. COBOL stands for common business oriented language. It runs a lot like the English language and it is used mostly by business and finance companies. I was able to find out a lot about IBM's technology stack on a Quora's blog

<https://www.quora.com/What-is-IBMs-technology-stack>

## INTEL:

Intel is a little bit different of a company. They create chips while the other companies are software based companies not creating anything. When looking at jobs they had a more variety of jobs. <https://stackshare.io/intel/intel>

This website showed the stack of all the different applications and devOps used.
